

I have had difficulty contacting my group, as such, I am evaluating my own project plan for this assignment.

This project plan is easy for me to follow since I can follow my own thought process, but in review, I can see that it could be improved by a flow chart rather than pseudocode. This would eliminate some of the text-heaviness of the document. I included a general concept before starting my pseudocode and still find this helpful, so I would probably include this with a flow chart as well.

If I were to try to improve this project plan, I might switch to a flow chart, but I think more importantly, I would focus on the testing plan. While it worked for this code, I think the code could easily be expanded to do more complex tasks. In order to do so, a more comprehensive test plan would be necessary. For example, the test plan could include methods of testing feedback to the user if they provide invalid inputs using embedded loops.
